

TUTORIAL DE INTRODUCCION A GIT :

1.1 · Got 15 minutes and want to learn Git?

Git allows groups of people to work on the same documents (often code) at the same time, and without stepping on each other's toes. It's a distributed version control system.

Our terminal prompt below is currently in a directory we decided to name "octobox". To initialize a Git repository here, type the following command:

```
git init
```

Advice

Directory:
A folder used for storing multiple files.

Repository:
A directory where Git has been initialized to start version controlling your files.

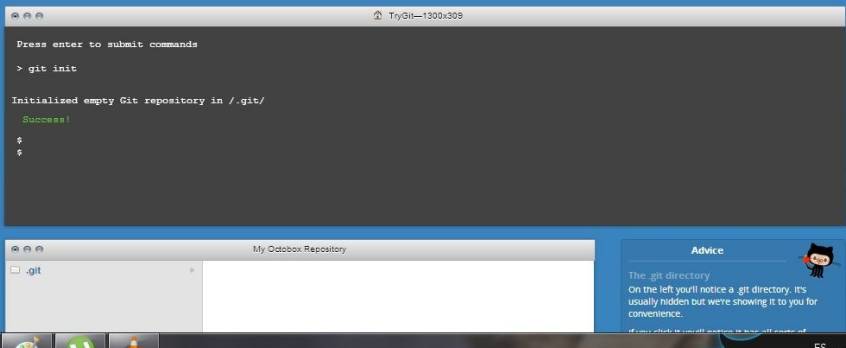

1.2 · Checking the Status

Good job! As Git just told us, our "octobox" directory now has an empty repository in `/.git/`. The repository is a hidden directory where Git operates.

To save your progress as you go through this tutorial -- and earn a badge when you successfully complete it -- head over to [create a free Code School account](#). We'll wait for you here.

Next up, let's type the `git status` command to see what the current state of our project is:

```
git status
```

Advice

The `.git` directory

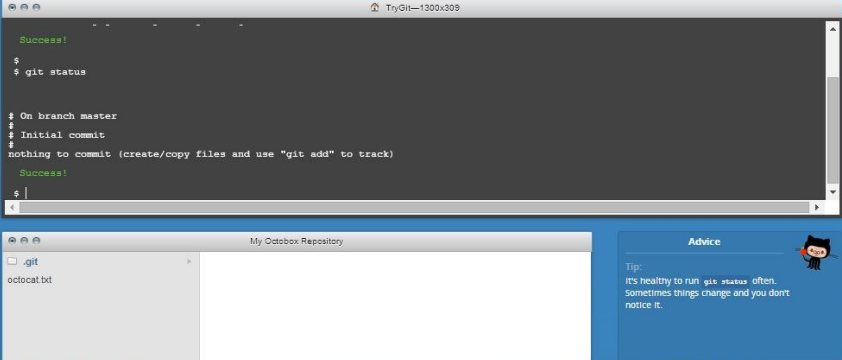

On the left you'll notice a `.git` directory. It's usually hidden but we're showing it to you for convenience.

1.3 · Adding & Committing

I created a file called **octocat.txt** in the octobox repository for you (as you can see in the browser below).

You should run the **git status** command again to see how the repository status has changed:

[git status](#)

TryGit

Advice

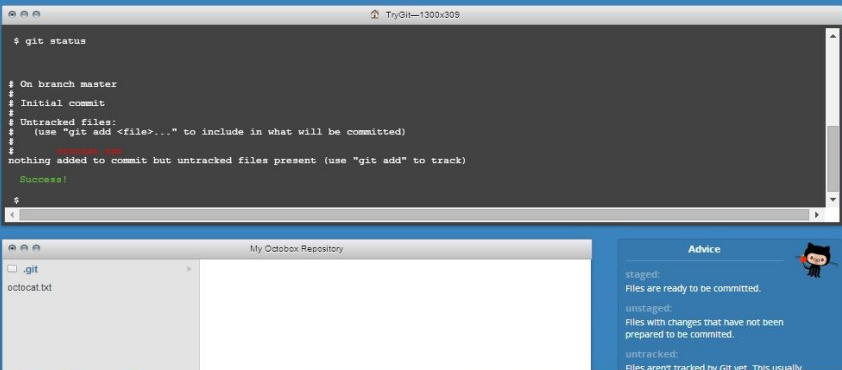

Tip: It's healthy to run `git status` often. Sometimes things change and you don't notice it.

1.4 · Adding Changes

Good, it looks like our Git repository is working properly. Notice how Git says **octocat.txt** is "untracked"? That means Git sees that **octocat.txt** is a new file.

To tell Git to start tracking changes made to **octocat.txt**, we first need to add it to the staging area by using **git add**.

[git add octocat.txt](#)

TryGit

Advice

staged: Files are ready to be committed.

unstaged: Files with changes that have not been prepared to be committed.

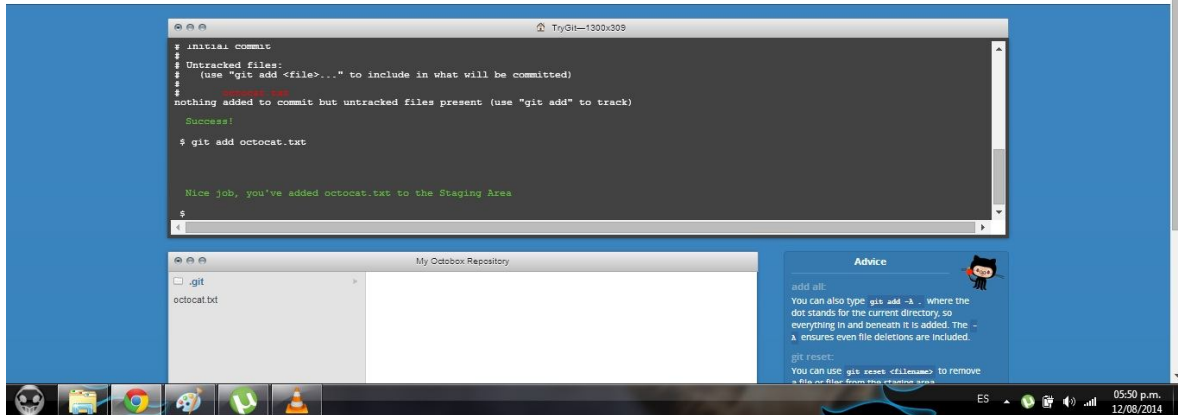

untracked: Files aren't tracked by Git yet. This is usual.

1.5 · Checking for Changes

Good job! Git is now tracking our `octocat.txt` file. Let's run `git status` again to see where we stand:

[git status](#)

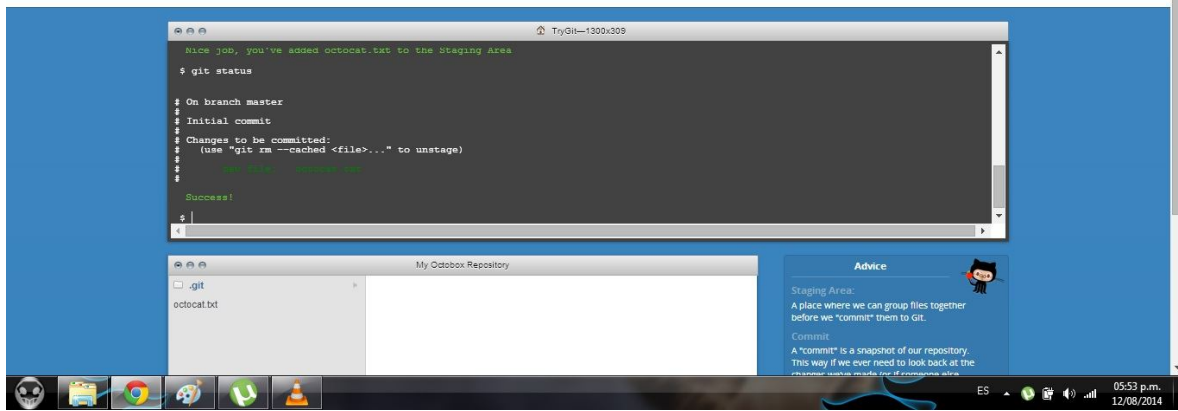

1.6 · Committing

Notice how Git says **changes to be committed**? The files listed here are in the **Staging Area**, and they are not in our repository yet. We could add or remove files from the stage before we store them in the repository.

To store our staged changes we run the **commit** command with a message describing what we've changed. Let's do that now by typing:

[git commit -m "Add cute octocat story"](#)

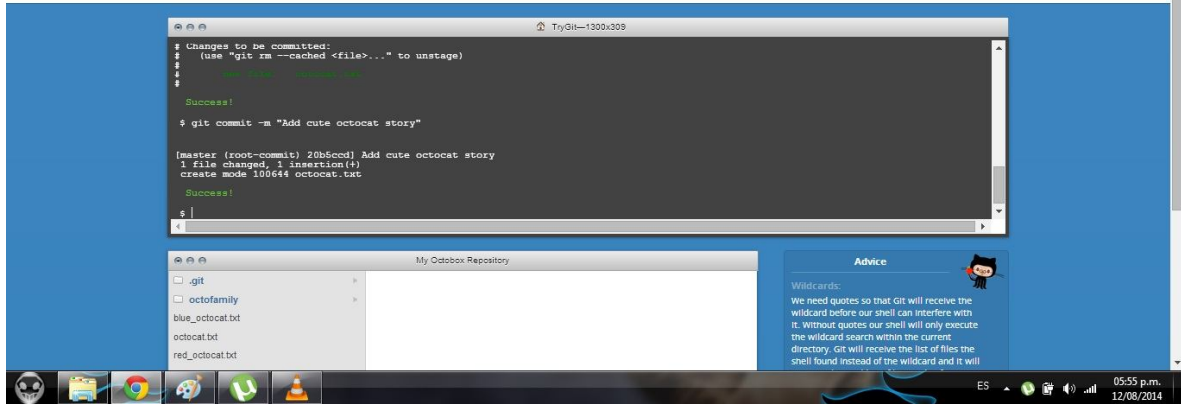

1.7 · Adding All Changes

Great! You also can use wildcards if you want to add many files of the same type. Notice that I've added a bunch of .txt files into your directory below.

I put some in a directory named "octofamily" and some others ended up in the root of our "octobox" directory. Luckily, we can add all the new files using a wildcard with **git add**. Don't forget the quotes!

→ `git add '*.txt'`

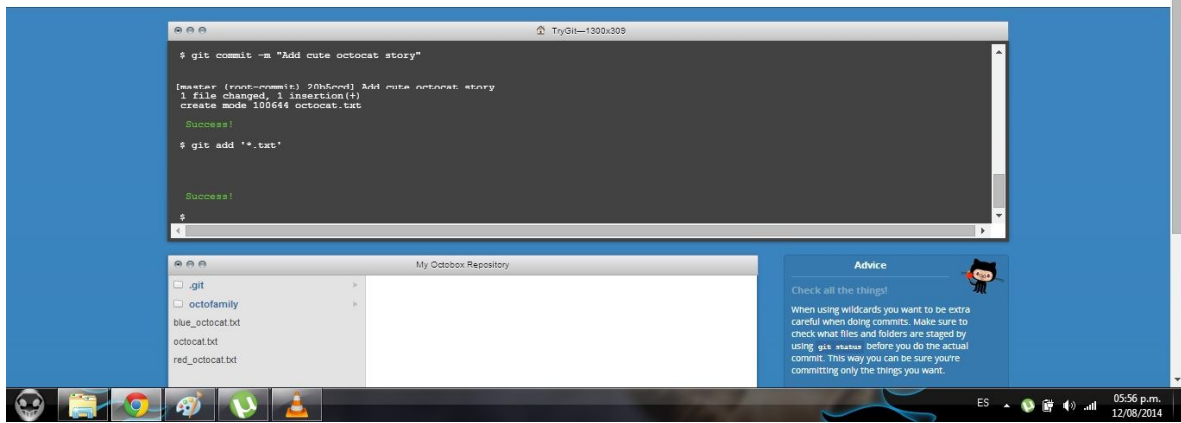

1.8 · Committing All Changes

Okay, you've added all the text files to the staging area. Feel free to run `git status` to see what you're about to commit.

If it looks good, go ahead and run:

→ `git commit -m 'Add all the octocat txt files'`

David te envío un mensaje · x Clase %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/9

1.9 · History

So we've made a few commits. Now let's browse them to see what we changed.

Fortunately for us, there's **git log**. Think of Git's log as a journal that remembers all the changes we've committed so far, in the order we committed them. Try running it now:

[git log](#)

```
TryGit-1200x300
$ git commit -m 'Add all the octocat txt files'

[master 3852b4d] Add all the octocat txt files
4 files changed, 4 insertions(+)
create mode 100644 blue_octocat.txt
create mode 100644 octofamily/baby_octocat.txt
create mode 100644 octofamily/momma_octocat.txt
create mode 100644 red_octocat.txt

$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

More useful logs:
Use `git log --summary` to see more information for each commit. You can see where new files were added for the first time or where files were deleted. It's a good overview of what's going on in the project.

05:57 p.m. 12/08/2014

1.10 · Remote Repositories

Great job! We've gone ahead and created a new empty GitHub repository for you to use with Try Git at <https://github.com/try-git/try-git.git>. To push our local *repo* to the GitHub server we'll need to add a remote repository.

This command takes a *remote name* and a *repository URL*, which in your case is <https://github.com/try-git/try-git.git>.

Go ahead and run **git remote add** with the options below:

[git remote add origin https://github.com/try-git/try-git.git](#)

```
TryGit-1200x300
$ git log

commit 3852b4db1634463d0bb4d267edb7b3f9ed02ace1

Date: Sat Oct 10 08:30:00 2020 -0500
    Add all the octocat txt files

commit b652edfd88cd3d5e7fcb857d0dab5a0fcb5e28
Author: Try Git <try_git@github.com>
Date: Sat Oct 10 08:30:00 2020 -0500
    Added cute octocat story

$
```

My Octobox Repository

- .git
- octobox

Advice

git remote:
Git doesn't care what you name your remotes, but it's typical to name your main one `origin`.
It's also a good idea for your main repository to be on a remote server like GitHub in case

05:57 p.m. 12/08/2014

David te envío un mensaje · x Clase %233.pdf x Code School - Try Git x

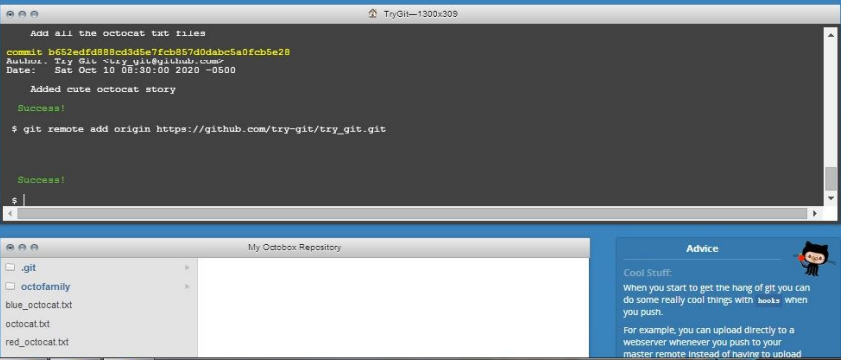

https://try.github.io/levels/1/challenges/11

1.11 - Pushing Remotely

The push command tells Git where to put our commits when we're ready, and boy we're ready. So let's push our local changes to our **origin** repo (on GitHub).

The name of our remote is **origin** and the default local branch name is **master**. The **-u** tells Git to remember the parameters, so that next time we can simply run **git push** and Git will know what to do. Go ahead and push it!

[git push -u origin master](#)

```
TryGit-1300x309
Add all the octocat txt files
commit b652edf4888cd3d5e7fcb857d0dabc5a0fcb5e28
Author: Try Git <try-git@github.com>
Date: Sat Oct 10 08:30:00 2020 -0500
Added cute octocat story
Success!
$ git remote add origin https://github.com/try-git/try_git.git
Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

Cool Stuff:

When you start to get the hang of git you can do some really cool things with `books` when you push.

For example, you can upload directly to a webserver whenever you push to your master remote instead of having to upload

05:58 p.m. 12/08/2014

Facebook x Clase %233.pdf x Code School - Try Git x

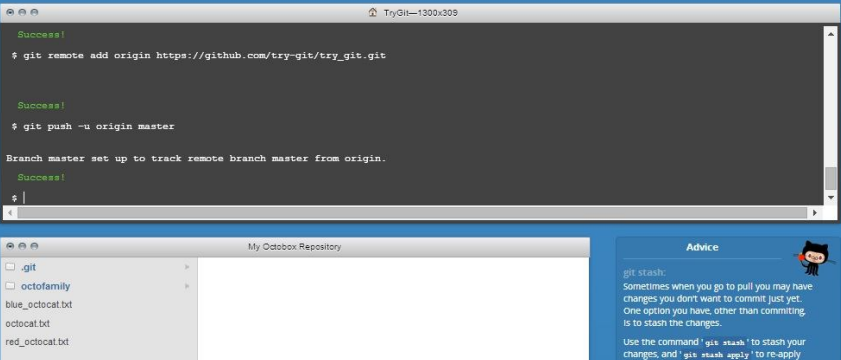

https://try.github.io/levels/1/challenges/12

1.12 - Pulling Remotely

Let's pretend some time has passed. We've invited other people to our github project who have pulled your changes, made their own commits, and pushed them.

We can check for changes on our GitHub repository and pull down any new changes by running:

[git pull origin master](#)

```
TryGit-1300x309
Success!
$ git remote add origin https://github.com/try-git/try_git.git
Success!
$ git push -u origin master
Branch master set up to track remote branch master from origin.
Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

git stash:

Sometimes when you go to pull you may have changes you don't want to commit just yet. One option you have, other than committing, is to stash the changes.

Use the command `'git stash'` to stash your changes, and `'git stash apply'` to re-apply your changes after your pull.

05:59 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/13

1.13 - Differences

Uh oh, looks like there have been some additions and changes to the octocat family. Let's take a look at what is **different** from our last commit by using the **git diff** command.

In this case we want the diff of our most recent commit, which we can refer to using the **HEAD** pointer.

[git diff HEAD](#)

```
TryGit-1300x309
Branch master set up to track remote branch master from origin.
$ git pull origin master
Updating 3852b4d..3e70b0f
Fast-forward
 yellow_octocat.txt | 1
 1 file changed, 1 insertion(+)
 create mode 100644 yellow_octocat.txt
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

05:59 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/14

1.14 - Staged Differences

Another great use for **diff** is looking at changes within files that have already been staged. Remember, staged files are files we have told git that are ready to be committed.

Let's use **git add** to stage **octofamily/octodog.txt**, which I just added to the family for you.

[git add octofamily/octodog.txt](#)

```
TryGit-1300x309
$ git diff HEAD
diff --git a/octocat.txt b/octocat.txt
index 7db8005..e725ef5 100644
--- a/octocat.txt
+++ b/octocat.txt
@@ -1,11 @@
-# Data as of 2014-08-08
+
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

Commit Etiquette:
You want to try to keep related changes together in separate commits. Using **git diff** gives you a good overview of changes you have made and lets you add files or directories one at a time and commit them separately.

06:00 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/15

1.15 - Staged Differences (cont'd)

Good, now go ahead and run **git diff** with the **--staged** option to see the changes you just staged. You should see that **octodog.txt** was created.

[git diff --staged](#)

```
TryGit-1300x309
$ git diff --staged
diff --git a/octocat.txt b/octocat.txt
index 7dbd008..e725ef6 100644

Facebook x Clase %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/17

1.17 - Undo

git reset did a great job of unstaging octocat.txt, but you'll notice that he's still there. He's just not staged anymore. It would be great if we could go back to how things were before octodog came around and ruined the party.

Files can be changed back to how they were at the last commit by using the command: `git checkout -- <target>`. Go ahead and get rid of all the changes since the last commit for `octocat.txt`

[git checkout -- octocat.txt](#)

```
diff --git a/octofamily/octodog.txt b/octofamily/octodog.txt
new file mode 100644
index 0000000..c1bc74e
--- /dev/null
+++ b/octofamily/octodog.txt
@@ -0,0 +1 @@
```

Success!

`$ git reset octofamily/octodog.txt`

Success!

`$`

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

The '-'

So you may be wondering why I have to use this '-' thing? `git checkout` seems to work fine without it, it's simply promising the command line that there are no more options after the '-'. This way if you happen to have a branch named

ES 06:02 p.m. 12/08/2014

Facebook x Clase %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/18

1.18 - Branching Out

When developers are working on a feature or bug they'll often create a copy (aka. **branch**) of their code they can make separate commits to. Then when they're done they can merge this branch back into their main **master** branch.

We want to remove all these pesky octocats, so let's create a branch called **clean_up**, where we'll do all the work:

[git branch clean_up](#)

```
Success!
$ git reset octofamily/octodog.txt
Success!
$ git checkout -- octocat.txt
Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

Branching

Branches are what naturally happens when you want to work on multiple features at the same time. You wouldn't want to end up with a master branch which has Feature A half done and Feature B half done.

Rather you'd separate the code base into

ES 06:02 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

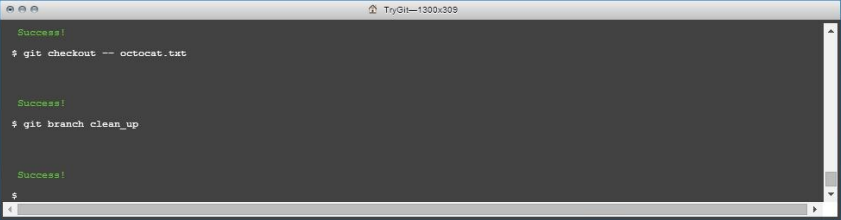

https://try.github.io/levels/1/challenges/19

1.19 - Switching Branches

Great! Now if you type **git branch** you'll see two local branches: a main branch named **master** and your new branch named **clean_up**.

You can switch branches using the **git checkout <branch>** command. Try it now to switch to the **clean_up** branch:

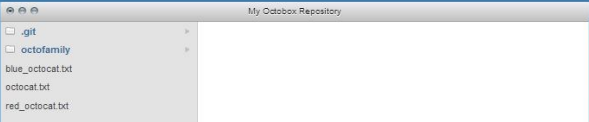

git checkout clean_up

```
Success!
$ git checkout -- octocat.txt

Success!
$ git branch clean_up

Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

All at Once

You can use:

```
git checkout -b new_branch
```

to checkout and create a branch at the same time. This is the same thing as doing:

```
git branch new_branch
```

06:03 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

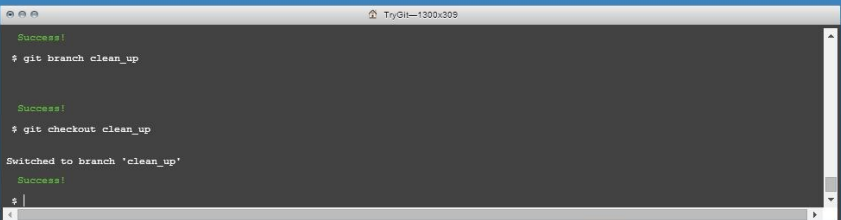

https://try.github.io/levels/1/challenges/20

1.20 - Removing All The Things

Ok, so you're in the **clean_up** branch. You can finally remove all those pesky octocats by using the **git rm** command which will not only remove the actual files from disk, but will also stage the removal of the files for us.

You're going to want to use a wildcard again to get all the octocats in one sweep, go ahead and run:

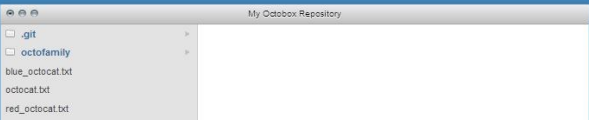

git rm *.txt

```
Success!
$ git branch clean_up

Success!
$ git checkout clean_up

Switched to branch 'clean_up'
Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

Remove all the things!

Removing one file is great and all, but what if you want to remove an entire folder? You can use the recursive option on **git rm**.

```
git rm -r folder_of_cats
```

This will recursively remove all folders and files from the given directory.

06:03 p.m. 12/08/2014

Facebook x Clase %233.pdf x Code School - Try Git x

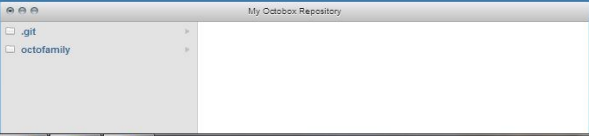

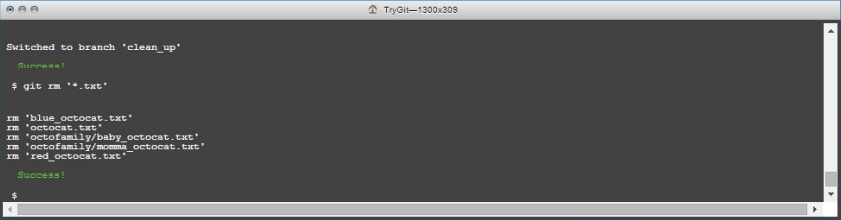

https://try.github.io/levels/1/challenges/21

1.21 · Committing Branch Changes

Now that you've removed all the cats you'll need to commit your changes.

Feel free to run `git status` to check the changes you're about to commit.

[git commit -m "Remove all the cats"](#)

Advice

The `-a` option

If you happen to delete a file without using `git rm`, you'll find that you still have to `git rm` the deleted files from the working tree. You can save this step by using the `-a` option on `git commit`, which automatically removes deleted files with the commit.

ES 06:03 p.m. 12/08/2014

Facebook x Clase %233.pdf x Code School - Try Git x

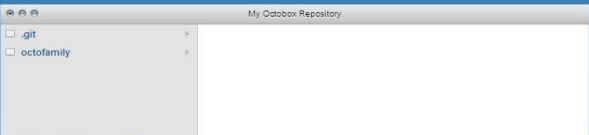

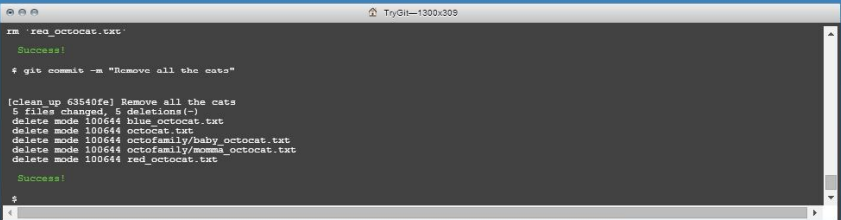

https://try.github.io/levels/1/challenges/22

1.22 · Switching Back to master

Great, you're almost finished with the cat... or the bug fix, you just need to switch back to the **master** branch so you can copy (or **merge**) your changes from the **clean_up** branch back into the **master** branch.

Go ahead and checkout the **master** branch:

[git checkout master](#)

Advice

Pull Requests

If you're hosting your repo on GitHub, you can do something called a pull request.

A pull request allows the boss of the project to look through your changes and make comments before deciding to merge in the change. It's a really great feature that is used all over the place. [Read more about pull requests](#)

ES 06:04 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/23

1.23 - Preparing to Merge

Alrighty, the moment has come when you have to merge your changes from the **clean_up** branch into the **master** branch. Take a deep breath, it's not that scary.

We're already on the **master** branch, so we just need to tell Git to merge the **clean_up** branch into it.

[git merge clean_up](#)

```
TryGit-1300x309
(clean_up) octocat:~$ rm -rf .
5 files changed, 5 deletions(-)
delete mode 100644 blue_octocat.txt
delete mode 100644 octocat.txt
delete mode 100644 octofamily/baby_octocat.txt
delete mode 100644 octofamily/momma_octocat.txt
delete mode 100644 red_octocat.txt

Success!
$ git checkout master
Switched to branch 'master'

Success!
$
```

My Octobox Repository

- .git
- octofamily
- blue_octocat.txt
- octocat.txt
- red_octocat.txt

Advice

Merge Conflicts

Merge Conflicts can occur when changes are made to a file at the same time. A lot of people get really scared when a conflict happens, but fear not! They aren't that scary, you just need to decide which code to keep.

Merge conflicts are beyond the scope of this

06:05 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/24

1.24 - Keeping Things Clean

Congratulations! You just accomplished your first successful bugfix and merge. All that's left to do is clean up after yourself. Since you're done with the **clean_up** branch you don't need it anymore.

You can use **git branch -d <branch name>** to delete a branch. Go ahead and delete the **clean_up** branch now.

[git branch -d clean_up](#)

```
TryGit-1300x309
Updating 3852b4d..ec688bb
Fast-forward
 blue_octocat.txt      | 1
 octocat.txt          | 1
 octofamily/baby_octocat.txt | 1
 octofamily/momma_octocat.txt | 1
 red_octocat.txt      | 1
 5 files changed, 5 deletions(-)
 delete mode 100644 blue_octocat.txt
 delete mode 100644 octocat.txt
 delete mode 100644 octofamily/baby_octocat.txt
 delete mode 100644 octofamily/momma_octocat.txt
 delete mode 100644 red_octocat.txt

Success!
$
```

My Octobox Repository

- .git
- octofamily

Advice

Force delete

What if you have been working on a feature branch and you decide you really don't want this feature anymore? You might decide to delete the branch since you're scrapping the idea. You'll notice that **git branch -d** **bad_feature** doesn't work. This is because - a won't let you delete something that hasn't

06:05 p.m. 12/08/2014

Facebook x Close %233.pdf x Code School - Try Git x

https://try.github.io/levels/1/challenges/25

1.25 - The Final Push

Here we are, at the last step. I'm proud that you've made it this far, and it's been great learning Git with you. All that's left for you to do now is to push everything you've been working on to your remote repository, and you're done!

[git push](#)

```
reg octocat.txt
5 files changed, 5 deletions(-)
delete mode 100644 blue_octocat.txt
delete mode 100644 octocat.txt
delete mode 100644 octofamily/hahy_octocat.txt
delete mode 100644 octofamily/mama_octocat.txt
delete mode 100644 red_octocat.txt

Success!

$ git branch -d clean_up

Deleted branch clean_up (was ec688bb).

Success!

$
